

The diagram illustrates the process by which geothermal energy is used in the production of electricity. Overall, there are five steps in the process, but the common process is evident in the Injection Well and Production Well. ~~starting from pumping down cold water into the geothermal zone, to producing electricity from the generator which is then sent into the electrical grid.~~

In the **first step**, cold water is pumped down 4.5 km underground through the injection well. Next, the water is injected into the geothermal zone, where hot rocks heat the water up as it passes through the Earth. Once the water has been heated up, it enters the production well and is then pumped up to the ground and into the condenser.

Formatted: Highlight

~~The last two stages are carried out above ground at the power plant. First of all, In comparison to the hot water produced by the production well, once it is pumped up to the condenser – steam is then produced steam is produced from the hot water in the condenser. In the following step, That steam passes into through the turbine which powers it to make it spin and makes it spin.~~

Formatted: Highlight

Finally, ~~the generator, which is powered by the turbine while the turbine spins which is powered by the steam, the generator will now be powered by it which,~~ produces electricity where it is then transferred into the electric grid via power lines.

Most organisations pay higher salaries to employees holding senior management positions. The writer believes in my opinion this is justified because senior level employees tend to have more responsibilities.

~~They also have more degrees and experience.~~

If companies pay higher salaries to senior executives, that is because these positions come with a lot of responsibilities. Responsibilities such as; managing employees, administration work etc. For example, the branch manager of a company is responsible for overseeing the operations of the entire branch whereas a junior level employee only has to take care of their respective job. A customer care executive is only responsible for answering the queries of customers. They are not held responsible if a product or

Formatted: Font color: Red

service fails in the market. A production head, on the other hand, is answerable to the executives above him if a particular product fails. Obviously, senior level positions are highly demanding. What's more, in order to be able to occupy such positions, an employee needs to have years of experience and degrees from top tier institutions. Therefore, in my opinion, the higher salaries that seniors command due to responsibilities are justified.

The organisation also gets to retain their key people when they give higher remuneration to seniors. At the same time, the higher wages of managers and CEOs encourage junior level employees to work harder for promotions and raises. This, in turn, increases the productivity of the organisation.

- Tangential

To conclude, in my opinion, salaries should be commensurate with the experience and job profile of an employee. Since, senior level executives have more responsibilities than the people who work under them, it is imperative that they are paid more.
